

HAIR PREPARATION GUIDE

HAIR TYPE 1-2

PAXMAN[®]

CHANGING THE FACE OF CANCER

It is important that you prepare your hair before you fit your cold cap on the day of your treatment.

This will help to ensure that you get the best possible results from the scalp cooling process.

By prepping the hair, we are aiming to:

- reduce the volume of the hair and get rid of any air pockets which may insulate the scalp
- aid conductivity to ensure heat travels easily away from your scalp
- ensure that the cap is easy to remove once your session is finished

IDENTIFYING **YOUR HAIR** - STRAIGHT & WAVY

Use your spray bottle to dampen your hair. There is no specific amount of water required, as each person's hair is different, but your hair will need to be damp enough to slick your hair back, but not so it is drenched.

There is no need to dampen the lengths of your hair if it is long, just the hair that will be under the cap.

Once you have dampened your hair, push it back and away from forehead, particularly if you have a fringe or bangs, so that you can see your hairline.

Use a small amount of conditioner, about the size of a coin, and smooth over the surface of the dampened hair. You don't need a huge amount or to work it in to the hair, the conditioner is only there to aid the removal of the cap once your treatment is complete.
